

If you already have idler rolls that can allow for wrap around the rod and a method for applying the coating, our ROD HOLDER makes adding or updating a rod coating station a simple task rather than a complex project. Coating rods under 1" in diameter need to be supported. Rods should also be rotated to provide the best coating. A rotating rod needs to be cleaned or wiped in order to keep the coating from being splashed onto the already metered surface. The UHMW rod bed provides this wiping action. Small weep holes in the side of the "V" keep any coating from accumulating under the rod.

The ROD HOLDER can support coating rods down to 1/4" diameter.

The 1-1/4" x 3" Aluminum Support Bar provides rigidity while the 1-1/4" x 1" UHMW Rod Bed provides a smooth, straight, non-abrasive and long wearing surface to contact the rod. It is available with a variable speed reversible Gast geared air motor with control panel or a variable speed reversible DC electric motor with a wired remote control for power, speed and direction. Either power source comes with a QuickCoupler.
